IMPROVE PURCHASING ACTIVITY WITH WEBCIS 4.0

## TRANSPARENCY AND SAVINGS MEASUREMENT FROM MATERIALS MANAGEMENT DATA

How high is the contribution of purchasing to the corporate result and how does current data transparency support this? Industrial purchasing is responsible for the largest cost block of a company, with a share of sales of more than 50%. Every cost reduction has a direct effect on the profit and loss account. The effect on the result and the purchasing influence can be measured and displayed in WebCIS 4.0. This measurement aims to derive potential for action to improve purchasing activities. The purchasing analyses

in WebCIS 4.0 are based on all invoice and order documents in the ERP systems. They enable every purchaser to analyze not only the order, invoice and commitment volumes, but also price developments and their influencing factors - currency, market indices, materials planning, contracts - and to influence them through his own actions. The freely adaptable analyses available in WebCIS 4.0 are directed at all dimensions of action, such as suppliers, group structures, material groups, plants, part numbers and user-defined texts, and enable unrestricted transparency through the traceability of all data down to the original documents.
